| <b>Course Description</b><br>The course constitutes an elective to be offered to M.Sc. (Natural Resources). It begins by exposing students to basic concepts in optimization and relevant introductory topics in microeconomics. Different categories of natural resources are covered separately with focus on forestry, fishery and exhaustible energy resources. This is followed by discussions on stock pollutants, issues of risk and uncertainty and biodiversity conservation and valuation. The course includes additional modules relating to: (a) the sustainable development concepts, relevant indicators (such as genuine savings) and natural resource accounting and (b) to the economics of property rights regimes (with focus on common property rights). It is expected that the course will help bridge the gap between theoretical models and empirical study of resource allocation and management issues in a real-world context. |  |  |                              |              |          |
