Course title: Energy Efficient Buildings			
Course code: MEU 112	**No. of credits:** 2	**L-T-P:** 20-0-16	**Learning hours:** 28
Pre-requisite course code and title (if any): NA			
Department: Department of Policy Studies			
Course coordinator: Hina Zia	**Course instructor:** Hina Zia		
Contact details: hzia@teri.res.in			
Course type: Elective	**Course offered in:** Semester 2		

Course description:

Low energy design is to design buildings such that their form, fabric and interior spaces respond to the local climate and utilise ambient energy to reduce load on building services. This course is an advanced version of this theme covered as part of first semester core course on Sustainable Provision and management of Urban Services. It will cover in detail passive building design strategies for providing natural lighting, cooling and heating in buildings. Principles of building physics that are required for understanding these have been introduced in earlier courses and in this course specific strategies will be explained.

Students will be familiarized with the key factors that need to be considered while designing daylighting and design parameters that affect daylight factor distribution in a space. An overview of the different techniques of enhancing daylighting in a building will be given to students. Second part of the course will cover the subject of passive/low energy solar heating and cooling systems. This will include an overview of the main design features of different types of systems, their advantages and disadvantages and their applicability to different building types and climatic regions.

At the end of the course students will be able to develop an understanding of low energy building design to provide natural lighting, cooling and heating in buildings.

Course objectives:

This course aims to provide an understanding of the concept of reduction in energy consumption through low energy building design. It will highlight strategies to integrate daylighting and low energy heating/cooling in buildings.

Course contents

Module	Topic	L	T	P
1	**Module 1: Introduction to energy efficient buildings**	**1**		
2	**Module 2: Daylighting** a) Daylighting(concept, components, relationship between daylight and human health and benefits of daylighting) b) Sky condition models and their characteristics c) Parameters for daylighting design (critical indoor illuminance, critical outdoor illuminance level, daylight factor distribution and glare) d) Parameters affecting daylighting factor (room depth, height of the window head, shading devices, glazing type, reflectance of room surfaces) e) Daylighting components (intermediate light spaces, interior light spaces, lateral pass-through components, zenithal pass-through components, global pass-through components) f) Control elements	**7**		
3	**Module 3: Passive/low energy heating systems** a) Principle of passive heating b) Types of passive heating systems	**2**		
4	**Module 4: Passive/low energy cooling systems** a) Building design strategies to reduce cooling demand b) Types of passive cooling systems (evaporative cooling, indirect evaporative cooling and earth cooling systems)	**4**		

5	**Module 5: Building Performance Modelling** a) Introduction to simulation tools b) Weather simulation and analysis tool (Climate Analysis, Solar Exposure analysis, Passive strategies through psychometric chart) c) Solar study d) Daylight analysis	**6**		
	Total	**20**		**16***

* Case study / field visits pertaining to energy efficient buildings

Evaluation criteria:

		Weightage (%)
Case study	:	50%
Design Problem	:	50%

Learning outcomes:

On completion of this course, the students would:

a) Have acquired an understanding of the concept and theoretical background of low energy building design.
b) Be able to demonstrate their learning about use of simulation tools to achieve energy efficiency.

Pedagogical approach:

The course will be delivered through a mix of classroom lectures and practical exercises.

Readings:
